

Assignment 4 Comprehension

B351 / Q351

Due: February 20th, 2018 @ 11:59PM

1 Alpha Beta

1. Write down the α - β value of each of the nodes that are NOT pruned in α - β pruning.

2. What is the optimal move for MAX?
3. Draw an example of a game tree (this tree does not have to be associated to a particular game) of depth 3 where α - β pruning will NOT prune anything.

2 Game Theory

Consider the following game played on a $1 \times N$ board: Two players take turns writing on the board. Each player can place an L or an O, and the first player who produces three consecutive boxes that spell LOL wins the game. For example, if $N = 3$ a possible game is as follows:

The first player writes an L in the first square, so the game is at position

L _ _

The second player places an L in the last square, so the game is at position

L _ L

[this is not a very smart move, by the way]

The first player places an O in the second square, so the game is at position

L O L

(so the first player wins).

1. Suppose that the first player places an L in the first square and that $N = 4$. Was this a good move? Justify your answer.
2. Who wins the game if $N = 7$? (the possibilities are the first player, the second player, or a draw. You must assume the players are playing to win!) Justify your answer.
